

IMS Fabtrack's Suppliers of Choice (SOC) application provides quick access to supplier inventory levels. Suppliers can update material status and delivery details for purchase orders electronically via the IMS FTP site. This allows for up-to-date status for project reporting. Suppliers can receive and store materials and ship items as requested by the project. Shipment details are posted to IMS Fabtrack, allowing receiving locations to view details and link to the receiving documents. Supplier posting of Material Test Reports (MTRs) for piping items can be linked to shipments and receipt of items. It has become standard practice for some projects to complete order releases for materials based on drawing requirements. This helps ensure items are shipped only as required and limits the amount of excess materials leaving supplier warehouse locations. Users have the option to view the supplier inventory levels at each of the supplier locations for items that have been purchased.

Standard Features

- Supplier catalogue data for link to project item codes and supplier item codes
- Item catalogue to include unit weights
- Automatic preparation of requisitions and purchase orders based on need to order quantities from MTO
- Updated purchase order status for delivery details
- Link of material items to (MTRs) material test reports
- Electronic shipment documents with link to (MTRs) and receiving of items
- Create order release shipments from supplier warehouse locations to project destinations
- Effective supply chain management for monitoring of potential excess materials
- Project look ahead reporting for work packages, turnaround activities that include SOC inventories
